Term Project – Phase 3 Description

We would like you to update some of the pages you have developed during the last phase. Please add AJAX to the following functionalities in your web application such that it seems more responsive and does not require as many jumps between pages.

Add AJAX functionality to the following:

1. In the 'Manager Home Page', when the user put the mouse over a request, it will trigger an AJAX to a PHP page that will return a description of the request. The PHP page should return the description as JSON. Show the description in a text box attached to the mouse.

2. In the 'Manager Home Page', clicking 'approve' or 'decline' next to a request will trigger an AJAX request to the appropriate PHP page. When the PHP page responds successfully, the manager home page should update the interface accordingly.

Notes:
· Design and use your own structure that will adequately represent the data.
· You may implement AJAX using native JS code or jQuery.

Submission:
You need to submit your NetBeans project folder after exporting it. It should include all your website pages (HTML, CSS, JS, images, and PHP) in a working hierarchy. In addition, you also need to submit the exported DB. One member of each group should submit the phase files via LMS. An LMS link for your submissions will be announced soon.

Submission deadline: Before 11:59 pm on Sunday, April 17.
